acid) and the "Surlyn®" resins are zinc, sodium, magnesium, etc. salts of poly(ethylene-methacrylic acid), distinct differences in properties exist.

When utilized in the construction of the inner layer of a multi-layered golf ball, it has been found that the low acid ionomer blends extend the range of compression and spin rates beyond that previously obtainable. More preferably, it has been found that when two or more low acid ionomers, particularly blends of sodium and zinc ionomers, are processed to produce the covers of multi-layered golf balls, (i.e., the inner cover layer herein) the resulting golf balls will travel further and at an enhanced spin rate than previously known multi-layered golf balls. Such an improvement is particularly noticeable in enlarged or oversized golf balls.

As shown in the Examples, use of an inner layer formulated from blends of lower acid ionomers produces multi-layer golf balls having enhanced compression and spin rates. These are the properties desired by the more skilled golfer.

In a particularly preferred embodiment of the inner cover layer, a blend of high and low acid ionomer resins is used. These can be the ionomer resins described above, combined in a weight ratio which preferably is within the range of 10-90 to 90-10 high and low acid ionomer resins.

Another embodiment of the inner cover layer is primarily or fully non-ionomeric thermoplastic material. Suitable non-ionomeric materials include metallocene catalyzed polyolefins or polyamides, polyamide/ionomer blends. polycarbonates, polyphenylene ether/ionomer blends, etc., which has a Shore D hardness of > 60 and preferably have a flex modulus of greater than about 30,000 psi, or other hardness and flex modulus values which are comparable to the properties of the ionomers described above. Other suitable materials include but are not limited to thermoplastic or thermosetting polyurethanes/polyureas, including castable polyurethanes/polyureas, reaction injection moldable polyurethanes/polyureas, thermoplastic block polyesters. such as a polyester elastomer marketed by DuPont under the trademark Hytrel®, thermoplastic block polyamides, such as a polyester amide marked by Elf Atochem S.A: under the trademark Pebax®, a blend of two or more non-

ionomeric thermoplastic elastomers, or a blend of one or more ionomers and one or more non-ionomeric thermoplastic elastomers. These materials can be blended with the ionomers described above in order to reduce cost relative to the use of higher quantities of ionomer.

5

10

A preferred embodiment golf ball of the present invention comprises one or more inner cover layers disposed about a core. For example, mantle or inner cover layer 24 is depicted in Figure 5. The thickness of a mantle layer is generally governed by the thicknesses and weights of other components in a golf ball, namely the core and cover layer(s). The mantle layer generally comprises one or more of the materials or compositions described herein for the outer cover layer.

15

The preferred composition for the inner cover layer may comprise up to 100 weight percent of a non-ionomeric thermoplastic or thermoset material including a polyester polyurethane such as B.F. Goodrich Company's Estane® polyester polyurethane X-4517 or a reaction-injection molded material such as one or more of the Bayflex RIM polyurethanes from Bayer. The non-ionomeric thermoplastic material may be blended with a soft ionomer. For example, polyamides blend well with soft ionomer. According to B.F. Goodrich, Estane® X-4517 has the following properties as set forth in Table 6:

20

TABLE 6
Properties of Estane® X-4517

	
Tensile	1430
100%	815
200%	1024
300%	1193

	100% 200% 300% Elongation Youngs Modulus Hardness A/D Bayshore Rebound Solubility in Water Melt processing temperature

Not true w'le thit lines may be ne suced mensus more conventional compression or injection nolding processes. RIM still gives products having "Knitted" areas and certainly still, along the parting line are generally the same as the properties of the mantle care material at other locations on the mantle, including at the poles. improvement in durability is believed to be a result of the fact that the reaction mixture is distributed uniformly into a closed mold. This uniform distribution of the injected materials eliminates knit-lines and other molding deficiencies which can be caused by temperature difference and/or reaction difference in the such as swirls. injected materials. The process of the invention results in generally uniform molecular structure, density and stress distribution as compared to conventional injection-molding processes. bubbles.

defect

The most preferred commercially available polyurethane material for forming golf ball mantles in accordance with the present invention is Bayflex MP-10,000 system from Bayer Corporation of Pittsburgh, Pennsylvania. Although the Bayflex MP-10,000 two component polyurethane system is purported to be proprietary, the following information is available, set forth below in Tables 7 and 8.

Details of Bayflex Component A are as follows in Table 7:

10

15

Into section is significantly provided in script and disclosure orth previous applications in this family of patents, i.e. ser u.s. 6,083,119,5,803,831 and moldable polyurethane and polyurea systems from Dow Chemical USA 20 (Midland, Michigan), including SPECTRIM MM 373-A (isocyanate) and 373-B (polyol), and Elastolit SR systems from BASF (Parsippany, New Jersey). Preferred RIM systems include Bayflex® MP-10,000 and Bayflex® 110-50, filled and unfilled. Further preferred examples are polyols, polyamines and isocyanates formed by processes for recycling polyurethanes and polyureas.

Outer Cover Layer

While the core with the hard inner cover layer formed thereon. provides the multi-layer golf ball with power and distance, the outer cover layer 16 is comparatively softer than the inner cover layer. The softness provides for the feel and playability characteristics typically associated with balata or balatablend balls. The outer cover layer or ply is comprised of a relatively soft, low modulus (about 1,000 psi to about 10,000 psi) and, in one embodiment, low acid (less than 16 weight percent acid) ionomer, an ionomer blend, a nonionomeric thermoplastic or thermosetting material such as, but not limited to. a metallocene catalyzed polyolefin such as EXACT material available from EXXON, a thermoplastic or thermoset polyurethane/polyurea, including injection moldable reaction castable polyurethanes/polyureas, polyurethanes/polyureas, and injection moldable polyurethanes/polyureas, polycarbonates, thermoplastic block polyesters, such as a polyester elastomer marketed by DuPont under the trademark Hytrel®, thermoplastic block polyamides, such as a polyester amide marketed by Elf Atochem S.A. under the trademark Pebax®, a blend of two or more non-ionomeric thermoplastic or thermosetting materials, or a blend of one or more ionomers and one or more non-ionomeric thermoplastic materials.

The outer layer is preferably from about 0.010 to about 0.150 inches in thickness, more preferably 0.02-0.10 inches, more desirably 0.03 to 0.06 inches in thickness for a 1.680 inch ball and 0.03 to 0.07 inches in thickness for a 1.72 inch or more ball), but thick enough to achieve desired playability characteristics while minimizing expense. Thickness is defined as the average thickness of the non-dimpled areas of the outer cover layer. The

20 A

5

10

15

25

30

-29-

It has been determined that when hard/soft ionomer blends are used for the outer cover layer, good results are achieved when the relative combination is in a range of about 3-25 percent hard ionomer and about 75-97 percent soft ionomer.

5

ngs

15

20

Moreover, in alternative embodiments, the inner and/or outer cover layer formulation may also comprise up to 100 wt % of a non-ionomeric thermoplastic or thermoset material including a polyester polyurethane such as B.F. Goodrich Company's Estarle® polyester polyurethane X-4517 or a reaction-injection molded material such as one or more of the Bayflex RIM polyurethanes from Bayer. The non-ionomeric thermoplastic material may be blended with a soft ionomer. For example, polyamides blend well with soft ionomer. The properties for Estane® X-4517 were previously noted.

Other soft, relatively low modulus non-ionomeric thermoplastic or thermoset materials may also be utilized to produce the inner and/or outer cover layer as long as the non-ionomeric materials produce the playability and durability characteristics desired without adversely effecting the enhanced travel distance characteristic produced by the high acid ionomer resin composition. These include, but are not limited to thermoplastic polyurethanes such as Texin thermoplastic polyurethanes from Mobay Chemical Co. and the Pellethane thermoplastic polyurethanes from Dow Chemical Co.; non-ionomeric thermoset polyurethanes including but not limited to those disclosed in U.S. Patent 5,334,673; cross-linked metallocene catalyzed polyolefins; ionomer/rubber blends such as those in Spalding U.S. Patents 4,986,545; 5,098,105 and 5,187,013; and, styrene-butadiene-styrene block copolymers, including functionalized styrene-butadiene-styrene block copolymers, styrene-ethylenebutadiene-styrene (SEBS) block copolymers such as KRATON materials from Shell Chemical Co., including functionalized SEBS block copolymers; and, Hytrel polyester elastomers from DuPont and Pebax polyesteramides from Elf Atochem S.A.

30

25

Notwithstanding the foregoing, it is most preferred to utilize a reaction injection molded (RIM) polyurethane cover as described herein.
